

## ABSTRACT

The present invention has its object to provide a polyester resin composition which can give molded articles 5 which even upon exposure to elevated temperatures, will not lose their surface gloss and will show little warping and are high in elastic modulus and thermal stability. Molding a polyester resin composition which comprises a polyalkylene terephthalate resin having an acid value of not higher than 30  $\mu\text{eq/g}$  and a 10 layered compound can make it possible to obtain the molded articles having the above-mentioned properties.
